Eric-

The salmon were hatchery fish that migrated through the Harbor before reaching their spawning grounds. From a biological standpoint, the actual point of collection (RM 6 vs. mouth of Clackamas) would not make a difference, as these fish are not feeding. And given the vast migration of these fish, I would argue that they were collected in the vicinity of the Superfund site. Although, I can see how you may run into some public perception issues with CAG, etc....

I don't have one spreadsheet that summarizes all the data. Chris Thompsen at Env. International put something together, but I haven't had a chance to review. Mike should have the same files from Chris.

Thanks Dave. I have a couple questions though. 1) I wasn't aware that the salmon sampling was performed on the Clackamas River - were any adult salmon collected from the Willamette in the vicinity of Portland Harbor; 2) Is there a spreadsheet that summarizes all the lamprey and sturgeon data for all contaminants?

Mike, do you have the data in spreadsheet format?

Thanks, Eric

Dana, Eric & Gina-

Here is what I have from MEL and Axys. Let me know if you still have any gaps. Also, let me know if you want the PBDE data. Hope all is well.

I know Dave has sent me this in the past but I am embarrassed to say that I cannot find it in my files. I have most of the raw data but it would be best to get the complete spreadsheets from Dave. Dave, bear with me on this. Can you send us your spreadsheets that summarize the data for sturgeon, lamprey and salmon if you have such a thing? Gina, do you have a summary of all of the data for each species or the data by analytical group for each species? I just want to make sure that all of us are using the same final data set. Sorry!!!

Lamprey and Sturgeon Data

Do either of you have the DHS lamprey and sturgeon data in a spreadsheet or other format. I have Mike Poulsen's summary and it appears incomplete.

Thanks, Eric
